The diamond was therefore a quasi-ellipsoid. And there are some other image processing techniques, which provide the surface structure much clearer than just looking at more or less raw images. I am also thinking that there is some tectonic style subduction at the crack.

In the Egyptian obelisks and hieroglyphical figures it is not easy to meet with. Your two pictures showing non-alignments for the two back rocks fall into the trap of angular anomalies and slight bends in the lines as shown in the pictures linked. And so, my final day dawns.

It is hand waving the contradictions away. What am I supposed to be seeing then? Higher variation gives the higher orbit crossover angles bigger than 0. And Rosetta still has lots of fuel, and just as important – funding – to plus up its ground breaking science discoveries.
